

## Debugging Code and Producing an Output File

### Code Snippet 1:

- Trying the code for the first time points out that there was a type error in the line `"a = "Hello" +1"` in which an integer is being used.
- Seeing this mistake means that the 1 in Hello must be converted to a string.
- This would turn to `a = "Hello" + str (1)`
- Next, to make sure the output file is created, you will have to close the file to create the output.
- That would be `"db.close()"`

### Code Snippet 2:

- Trying the code for the first time highlights a Syntax error in the for loop.
- For a for loop to work, it must have the colon at the end in the `"for l in a"`
- Doing this, the code would be `"for i in a:"`
- The print (`print(sum(i)*2)`) as well is not indented correctly as that is the main part that allows loops to be functional
- The print statement would be when indicated correctly = `print(sum(i) * 2)`
